

The Earth has one big ocean with many features.

The ocean is the dominant physical feature on our planet Earth—covering approximately 70% of the planet's surface. There is one ocean with many ocean basins, such as the North Pacific, South Pacific, North Atlantic, South Atlantic, Indian and Arctic.

DID YOU KNOW?

- The ocean is connected to major lakes, watersheds and waterways because all major watersheds on Earth drain to the ocean. So no matter where you live you are connected to world's one, large global ocean!
- Although the ocean is large, it is finite and resources are limited.

The ocean and life in the ocean shape the features of the Earth.

Many earth materials and geochemical cycles originate in the ocean. Many of the sedimentary rocks now exposed on land were formed in the ocean.

DID YOU KNOW?

- Sand consists of tiny bits of animals, plants, rocks and minerals. Most beach sand is eroded from land sources and carried to the coast by rivers, but sand is also eroded from coastal sources by surf. Sand is redistributed by waves and coastal currents seasonally.
- Sea level changes over time have expanded and contracted continental shelves, created and destroyed inland seas, and shaped the surface of the land.
- The Great Lakes are an example of an inland sea that has been shaped over 3 billion years of erosion, flooding by marine seas, sedimentation and glaciers.

The ocean is a major influence on weather and climate.

The ocean controls weather and climate by dominating the Earth's energy, water and carbon systems.

DID YOU KNOW?

- The ocean dominates the Earth's carbon cycle. Half the primary productivity on Earth takes place in the sunlit layers of the ocean and the ocean absorbs roughly half of all carbon dioxide added to the atmosphere.
- Since the ocean is a major influence on climate it plays a key role in the amount of rainfall an area has. The reasons the world has areas that have more or less rainfall are partially influenced by the ocean.
- Most rain that falls on land originally evaporated from the tropical ocean.

Where is the rainiest place on Earth

The wettest place in the world is Tutunend Colombia, with an average rainfall of 463.4 inches (1177 centimeters) per year. The place that has the most rainy days per year is Mount Wai-'ale'ale on the island of Kauai, Hawaii. It has up to 350 rainy days annually.

In contrast, the longest rainless period in the world was 14 years, from October 1903 to January 1918, at Arica, Chile. In the United States the longest dry spell was 767 days at Bagdad, California—from October 3, 1912 to November 8, 1914.

The ocean makes Earth habitable.

Algae in the ocean produce more of the Earth's vital oxygen than all of the forests and land plants combined.

DID YOU KNOW?

- The first life is thought to have started in the ocean. The earliest evidence of life is found in the ocean.
- There is evidence that the first living organism was primitive bacteria-like organisms that lived 3,850 million years ago.

The ocean supports a great diversity of life and ecosystems.

Ocean life ranges in size from the smallest virus to the largest animal that has lived on Earth, the blue whale.

DID YOU KNOW?

- The ocean is three-dimensional, offering vast living space and diverse habitats from the surface through the water column to the sea floor. Most of the living space on Earth is in the ocean.

The ocean and humans are inextricably interconnected.

The ocean affects every human life. It supplies fresh water (most rain comes from the ocean) and nearly all Earth's oxygen. It moderates the Earth's climate, influences our weather, and affects human health.

DID YOU KNOW?

- Much of the world's population lives in coastal areas.
- From the ocean we get food, medicines, and mineral and energy resources. In addition, it provides jobs, supports our nation's economy, serves as a highway for transportation of goods and people, and plays a role in national security.
- The single greatest source of ocean pollution is runoff from yards, pavement and farms.

The ocean is largely unexplored.

The ocean is the last and largest unexplored place on Earth—less than 5% of it has been explored. This is the great frontier for the next generation's explorers and researchers, where they will find great opportunities for inquiry and investigation.

DID YOU KNOW?

- The ocean covers two-thirds of planet Earth, yet we know more about the moon's surface than the deep ocean.
- The deepest anyone has ever gone in the ocean was in 1960, when U.S. Navy lieutenant, Don Walsh and Swiss oceanographer Jacques Piccard went to a depth of 35,800 feet in the "bathyscaphe" *Trieste*. This is the deepest place in the ocean. It is known as the Challenger Deep in the Mariana Trench off Guam.

Deep-sea Hydrothermal Vents

In 1977, scientists made a stunning discovery on the bottom of the Pacific Ocean that forever changed our understanding of planet Earth and life on it.

They found seafloor vents gushing shimmering, warm, mineral-rich fluids into the cold, dark depths. And, to their complete surprise, they found that then vents were brimming with extraordinary, unexpected life.
